1 Overview

1.1 Maven Site Indexer plugin

An easy way to index your maven site and give it a nice ajax search box.

It's as easy as:

- adding the plugin to your pom.xml (see <u>usage instructions</u> of course it should already have the site plugin configured)
- putting searchbox.html in src/site/resources (you can customize it if you have a good javascriptfu)

```
//in example you can change the positioning
$("#searchbox", window.parent.document).css('top', '10px');
$("#searchbox", window.parent.document).css('left', $(window).width()- 325);
...
<!-- or change the color of the search results box -->
<div style="background-color: lightyellow" id="searchOutput"/>
```

- putting search.js in src/site/resources/js (just put it as it is)
- · calling mvn site
- opening up your site and enjoying your nice and hassle-free search box!

Wanna see it in action? Look at the top right corner of this page ;) Wanna try it? It's apache licensed and you can find it on GitHub

2 Usage instructions

2 Usage instructions

2.1 Adding the plugin to your POM

The Maven Site Indexer is a standard maven plugin. Download the code, mvn install it and then add the following to your pom.xml
