1 Overview

....

1.1 Maven Site Indexer plugin

An easy way to index your maven site and give it a nice ajax search box.

It's **as easy as**:

- adding the plugin to your pom.xml (see usage instructions - of course it should already have the site plugin configured)
- putting searchbox.html in src/site/resources (you can customize it if you have a good javascript-fu)

```
//in example you can change the positioning
$("#searchbox", window.parent.document).css('top', '10px');
$("#searchbox", window.parent.document).css('left', $(window).width()- 325);
...
<!-- or change the color of the search results box -->
<div style="background-color: lightyellow" id="searchOutput"/>
```

- putting search.js in src/site/resources/js (just put it as it is)
- calling mvn site
- opening up your site and enjoying your nice and hassle-free search box!

Wanna see it in action? Look at the top right corner of this page ;) Wanna try it? It's apache licensed and you can find it on GitHub

2 Usage instructions

2.1 Adding the plugin to your POM

The Maven Site Indexer is a standard maven plugin. Download the code, mvn install it and then add the following to your pom.xml

```xml
<plugin>
  <groupId>org.apache.maven.plugins</groupId>
  <artifactId>index</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <executions>
    <execution>
      <phase>site</phase>
      <goals>
        <goal>index</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```
